Troubleshooting Guide

Document ID: NX-SUP-002 **Version:** 4.3 **Publication:** July 15, 2026 **Last updated:** September 13, 2026
Department: Customer Support **Category:** Troubleshooting **Confidentiality:** Customer Support **Applicable customers:** All

Fictional training dataset. All entities, people, locations, policies, prices and contact details are synthetic and created solely for RAG development.

Troubleshooting Matrix

Problem	Symptoms	Likely cause	First action
Login failure	User cannot authenticate.	Expired session, incorrect credentials or SSO configuration.	Verify account status, reset password, confirm IdP configuration.
Password reset	Reset email is not received.	Incorrect address, mail filtering or rate limit.	Verify account email, check spam/quarantine, request one reset and wait for delivery.
API authentication failure	NX-401 or repeated 401 responses.	Expired/revoked token or malformed Authorization header.	Verify Bearer token syntax, rotate token, retry once.
Rate limit exceeded	NX-429 responses.	Too many requests or burst exceeded.	Honor Retry-After, reduce concurrency and implement exponential backoff.
Webhook failure	Endpoint does not receive events.	Endpoint unavailable, signature rejection or timeout.	Check endpoint status, TLS, response time and event signature.
File upload failure	NX-413 or rejected format.	File exceeds size limit or format unsupported.	Check size, extension and plan limit. For Cloud Storage, verify bucket policy.
Integration failure	Connector stops syncing.	Credential expiration, schema change or upstream data change.	Reconfigure credentials, inspect sync log and compare schemas.
Slow dashboard	Analytics page loads slowly.	Large query, refresh window or upstream data delay.	Check time range, filter scope and refresh status.
AI request timeout	AI call exceeds client timeout.	Large input, service load or network timeout.	Reduce payload, use asynchronous workflow where possible.
Incorrect permissions	User can see less/more than expected.	Role assignment or workspace scope mismatch.	Review role, group membership and workspace scope.

Detailed Procedures

Login failure

Symptoms: User cannot authenticate.

Possible causes: Expired session, incorrect credentials or SSO configuration.

Diagnostic steps: Verify account status, reset password, confirm IdP configuration and check recent security events.

Escalation: If unresolved after identity verification, open a support case with workspace ID.

Password reset

Symptoms: Reset email is not received.

Possible causes: Incorrect address, mail filtering or rate limit.

Diagnostic steps: Verify account email, check spam/quarantine, request one reset and wait for delivery.

Escalation: Escalate with timestamp and account email domain.

API authentication failure

Symptoms: NX-401 or repeated 401 responses.

Possible causes: Expired/revoked token or malformed Authorization header.

Diagnostic steps: Verify Bearer token syntax, rotate token, retry once.

Escalation: Escalate with request_id; never send the secret token.

Rate limit exceeded

Symptoms: NX-429 responses.

Possible causes: Too many requests or burst exceeded.

Diagnostic steps: Honor Retry-After, reduce concurrency and implement backoff.

Escalation: If limits seem unexpectedly low, provide request volume and timestamps.

Webhook failure

Symptoms: Endpoint does not receive events.

Possible causes: Endpoint unavailable, signature rejection or timeout.

Diagnostic steps: Check endpoint status, TLS, response time and event logs.

Escalation: Provide event_id and delivery attempts.

File upload failure

Symptoms: NX-413 or rejected format.

Possible causes: File exceeds size limit or format unsupported.

Diagnostic steps: Check size, extension and plan limit. For Cloud standard plans, max is 2 GB/file.

Escalation: Escalate with file size and error code, not sensitive content.

Integration failure

Symptoms: Connector stops syncing.

Possible causes: Credential expiration, schema change or upstream outage.

Diagnostic steps: Reconnect credentials, inspect sync log and compare schema.

Escalation: Escalate after confirming external endpoint availability.

Slow dashboard

Symptoms: Analytics page loads slowly.

Possible causes: Large query, refresh window or upstream data delay.

Diagnostic steps: Check time range, filter scope and refresh status.

Escalation: Escalate with dashboard ID and timestamp.

AI request timeout

Symptoms: AI call exceeds client timeout.

Possible causes: Large input, service load or network timeout.

Diagnostic steps: Reduce payload, use asynchronous workflow where supported, retry with backoff.

Escalation: Escalate with model name, request_id and timing.

Incorrect permissions

Symptoms: User can see less/more than expected.

Possible causes: Role assignment or workspace scope mismatch.

Diagnostic steps: Review role, group membership and workspace scope.

Escalation: Escalate with user ID and expected role.

Escalation Rules

Severity classification follows 09_support_and_sla.pdf. A technical symptom does not automatically make an incident Severity 1; severity is based on business impact.
