

NEXORA

Security and Compliance Guide

Document ID: NX-SEC-001 Version: 3.9 Publication: August 8, 2026 Last updated: September 17, 2026

Department: Security Category: Security Confidentiality: Customer / Confidential Applicable customers: All

Fictional training dataset. All entities, people, locations, policies, prices and contact details are synthetic and created solely for RAG development.

Security Architecture

Nexora uses layered controls covering identity, network boundaries, application authorization, encryption, monitoring, backups and incident response. Security design is reviewed through internal change-management processes.

Encryption

- TLS 1.2+ for supported external connections
- AES-256-equivalent encryption at rest for managed customer storage
- Key access controlled through a managed key service
- Enterprise customers may have additional key-management requirements by agreement

Authentication and Authorization

Role-based access control is enforced at workspace scope. Business and Enterprise support SAML 2.0 SSO. SCIM provisioning is Enterprise-only.

Access Control

Administrative access follows least-privilege principles, approval workflows and audit logging. Production access is restricted to authorized personnel and reviewed periodically.

Backups and Disaster Recovery

Control	Fictional target
Backup frequency	Daily full + continuous incremental
Recovery point objective	4 hours
Recovery time objective	8 hours
Backup retention	35 days

Incident Response

Security incidents are triaged by impact. Material incidents may trigger customer notification according to contract and applicable requirements. Security contact: security@nexora.example.

Vulnerability Management

- Continuous dependency monitoring
- Scheduled vulnerability scanning

- Risk-based remediation targets
- Annual penetration testing by an independent fictional assessor
- Emergency patching for critical issues

Logging and Monitoring

Security-relevant authentication, administrative and system events are logged. Retention varies by system and customer configuration; Enterprise contracts can define additional retention requirements.

Compliance Programs

Nexora maintains fictional assurance programs named NX-Control Framework and NX-Trust Review. These are synthetic constructs for this dataset and are not real certifications.

Do not represent the fictional programs as ISO, SOC, PCI or other real-world certifications.

Customer Security Questionnaire

Enterprise customers may request security documentation, architecture summaries, subprocessors information and control responses through the sales and security process.
